Method of timer based download and playback scheme for Internet browser

Inventors: Wu; Alex C.(Fremont, CA); Pan; Sam Z. (Oakland, CA)

ABSTRACT

The invention is disclosed as a scheme for use in a browser application to schedule the download of the documents from a list of source server uniform resource locators in a networked environment at a specified time, and for a specified duration, and with a specified time interval. It can optionally save the downloaded documents onto a local storage, or storage at local network, or on a remote storage. The document downloaded over the network can be processed and rendered onto the browser at the specified time in the future. The invention further provides a scheme to schedule a download of the document based on a reference time embedded in the document downloaded from the source server.
